Precautions in Use

1. Soldering Condition

- a. When soldering, leave the minimum clearance between the bottom of the resin and the soldering point.
- b. Do not solder closer than 3mm from the base of the epoxy bulb.
- c. Maximum allowance soldering conditions are:
Dip Soldering: 260°C max., 5 sec Max., 1 time.
Soldering iron: 350°C max., 5 sec Max., 1 time
- d. Contact between molten solder and the resin shall be avoided.
- e. During soldering, do not put any stress on the lead frame, particularly when heated.

2. Lead frame Forming and Use

- a. When forming leads, the leads shall be bent at a point at least 3mm from the base of epoxy bulb. Do not use the base of the lead frame as a fulcrum during lead forming.
- b. Lead forming shall be done before soldering.
- c. Do not apply any bending stress to the base of the lead. The stress to the base may damage the LED's characteristics or it may break the LED.
- d. When mounting the LED onto a printed circuit board, the holes on the PCB shall be exactly aligned with the leads of the LED. If the LED is mounted with stress at the leads, it may cause deterioration of the epoxy resin and this may degrade the LED.
- e. Avoid condition which may cause the LED to corrode, tarnish or discolor. This corrosion or discoloration may cause difficulty during soldering operation. It is recommended that the LED be used as soon as possible.
- f. Avoid rapid transition in ambient temperature, especially in high humidity environment.

3. Static Electricity

- a. The product is sensitive to static electricity charge, and user is required to handle it with care. Particularly, if a current and/or voltage which exceed the Absolute Maximum Rating of the Product is applied, the overflow in energy may cause damage to, or possibly result in electrical destruction of, the LED. The customer is requested to take adequate countermeasure against static electricity charge and surge when handling it.
- b. Proper grounding, use of conductive mat, conductive working uniform and shoes, and conductive containers are effective against static electricity and surge.
- c. Ground low-resistance area where the product contacts, such as metal surface of the work platform, with a conductive mat (surface resistance $10^6 \sim 10^9$ ohm).
- d. A tip of soldering iron is requested to be grounded. An ionizer shall also be installed where risk of static generation is high.
